BACKGROUND OF THE INVENTION

1. Field of the Invention

15 The present invention relates to oil and gas well drilling,  
and more particularly to an improved downhole jar apparatus that  
delivers upward blows and which is activated by pumping a valving  
member or activator ball downhole through a tubing string or work  
string. Even more particularly, the present invention relates to  
20 an improved downhole jar apparatus for use in oil and gas wells  
that includes upper and lower pistons that are each movable between  
upper and lower positions, the lower piston having a valve seat and  
a valving member that can be moved to seal the valve seat wherein  
a trip mechanism separates the second valving member from the lower  
25 piston seat when a predetermined pressure value is overcome and a  
return mechanism returns the first piston to its upper position  
when the trip mechanism separates the second valving member from  
the lower piston seat to deliver an upward jar to the tool body.

2. General Background of the Invention

30 In downhole well operation, there is often a need for jarring  
or impact devices. For example, such a "jar" is often used in work  
over operations using a pipe string or work string such as a coil  
tubing unit or a snubbing equipment. It is sometimes necessary to

provide downward jarring impact at the bottom of the work string to enable the string to pass obstructions or otherwise enter the well. During fishing operations or other operations, such as opening restriction (i.e., collapsed tubing) it is sometimes necessary to apply upward jarring or impact forces at the bottom of the string if the fishing tool or the like becomes stuck.

In prior U.S. Patent 3,946,819, naming the applicant herein as patentee, there is disclosed a fluid operated well tool adapted to deliver downward jarring forces when the tool encounters obstructions. The tool of my prior U.S. Patent 3,946,819, generally includes a housing with a tubular stem member telescopically received in the housing for relative reciprocal movement between a first terminal position and a second terminal position in response to fluid pressure in the housing. The lower portion of the housing is formed to define a downwardly facing hammer and the stem member includes an upwardly facing anvil which is positioned to be struck by the hammer. The tool includes a valve assembly that is responsive to predetermined movement of the stem member toward the second terminal position to relieve fluid pressure and permit the stem member to return to the first terminal position. When the valve assembly relieves fluid pressure, the hammer moves into abrupt striking contact with the anvil. The tool of prior U.S. Patent 3,946,819, is effective in providing downward repetitive blows. The tool of the '819 patent will not produce upwardly directed blows.

In prior U.S. Patent 4,462,471, naming the applicant herein as patentee, there is provided a bidirectional fluid operated jarring apparatus that produces jarring forces in either the upward or downward direction. The jarring apparatus was used to provide upward or downward impact forces as desired downhole without removing the tool from the well bore for modification. The device provides downward jarring forces when the tool is in compression,

as when pipe weight is being applied downwardly on the tool, and produces strong upward forces when is in tension, as when the tool is being pulled upwardly.

In U.S. Patent 4,462,471, there is disclosed a jarring or drilling mechanism that may be adapted to provide upward and downward blows. The mechanism of the '471 patent includes a housing having opposed axially spaced apart hammer surfaces slidably mounted within the housing between the anvil surfaces. A spring is provided for urging the hammer upwardly.

In general, the mechanism of the '471 patent operates by fluid pressure acting on the valve and hammer to urge the valve and hammer axially downwardly until the downward movement of the valve is stopped, preferably by the full compression of the valve spring. When the downward movement of the valve stops, the seal between the valve and the hammer is broken and the valve moves axially upwardly. The direction jarring of the mechanism of the '471 patent is determined by the relationship between the fluid pressure and the strength of the spring that urges the hammer upwardly. Normally, the mechanism is adapted for upward jarring. When the valve opens, the hammer moves upwardly to strike the downwardly facing anvil surface of the housing.

#### BRIEF SUMMARY OF THE INVENTION

The downhole jar apparatus for use in oil and gas wells provides an improved construction that delivers upward blows only.

The apparatus can be activated by pumping a valving member (e.g., ball) downhole via a coil tubing unit, work string, or the like.

The present invention thus provides an improved downhole jar apparatus for use in oil and gas wells that includes an elongated tool body that is supportable by an elongated work string such as a coil tubing unit. The tool body provides an upper end portion that attaches to the coil tubing unit with a commercially available sub for an example, and a lower end portion that carries a working

member. Such a working member can include for example, a pulling tool to extract a fish, down hole retrievable controls, a gravel pack or a safety jar, a motor or directional steering tool.

The tool body has a longitudinal flow bore that enables fluid to flow through the tool body from the upper end to the lower end.

An upper piston (first piston) is slidably mounted within the tool body bore at the upper end portion thereof. The upper piston is movable between upper and lower positions and provides a valve seat.

A lower piston (second piston) is mounted in the tool body in sliding fashion below the upper piston and is also movable between upper and lower positions. The lower piston also provides a valve seat. A first valving member preferably in the form of a ball valving member is provided for sealing the valve seat of the upper piston.

The first valving member is preferably pumped downhole via the coil tubing unit or work string using fluid flow to carry it to the valve seat of the upper piston. A second valving member in the form of an elongated dart is disposed in between the upper and lower pistons. The second valving member has a lower valving end portion that can form a seat with the lower piston seat.

A trip mechanism is provided for separating the second valving member from the lower piston seat when a predetermined hydrostatic pressure value above the lower piston is overcome by compression of a spring portion of the trip mechanism.

A return mechanism returns the first piston to its upper position when the trip mechanism separates the second valving member from the lower piston seat.

The tool body has an anvil portion positioned above the lower piston for receiving blows from the lower piston when it rapidly returns to its upper position, once separated from the second valving member.

The tool body can include upper and lower tool body sections attached together end to end with a slip joint. This allows the force of upward blows delivered by the piston to exceed the tension applied from the surface through the tubing string.

5 A tappet can be provided above the first piston, the tappet and first upper piston being separately movable members with a beveled seat interface provided at the connection between the bottom of the upper piston and the top of the tappet.

10 The tappet is used to momentarily interrupt fluid flow when the second or dart valving member fires upwardly. This interruption of fluid flow contributes to the rapid upward movement of the lower piston so that it can impact the tool body providing an upward jar.

#### BRIEF DESCRIPTION OF THE DRAWINGS

15 For a further understanding of the nature, objects, and advantages of the present invention, reference should be had to the following detailed description, read in conjunction with the following drawings, wherein like reference numerals denote like elements and wherein:

20 Figure 1A is a sectional elevational view of the preferred embodiment of the apparatus of the present invention illustrating the upper portion thereof;

25 Figure 1B is a sectional elevational view of the preferred embodiment of the apparatus of the present invention illustrating the central portion thereof; and

Figure 1C is a sectional elevational view of the preferred embodiment of the apparatus of the present invention illustrating the lower end portion thereof.

#### DETAILED DESCRIPTION OF THE INVENTION

30 Figures 1A, 1B, and 1C show generally the preferred embodiment of the apparatus of the present invention designated generally by the numeral 10. Jar apparatus 10 is comprised of an elongated tool

body 11 having an upper end portion 12 and a lower end portion 13. The tool body 11 includes an upper tool body section 14 and a lower tool body section 15. The upper tool body section 14 is attached to the lower tool body section 15 through slip joint 46.

5 The tool body 11 has an elongated open ended flow bore 16 so that fluids can be pumped through the tool body 11 from the upper end 12 to the lower end 13.

10 At the upper end 12 of tool body 11, there is provided a first piston 17 having an O-ring 18 for forming a seal with tool body bore 16. Piston 17 sits upon tappet 23. The tappet 23 has a seat 19 that receives a ball valving member 20 that is dropped from the surface through a work string, coil tubing unit, or the like, so that the ball can be pumped down to the tool body 11 and into the bore 16 so that it registers upon the seat 19.

15 The upper end 12 of the tool body 11 provides internal threads 21 for forming a connection with a work string, coil tubing string, or the like. A commercially available connecting member or sub can be used to form an interface in between the tool body 11 and the coil tubing unit, work string, or the like. At its lower end portion, tappet 23 provides a generally flat surface 24 that receives a correspondingly shaped flat surface of dart valving member 31. Bore 16 enlarges below tappet 23 at 26. Annular shoulder 25A limits downward movement of piston 17 at shoulder 25B.

20 Flow channel 27 enables fluid to flow through the center of tappet 23 and around the tappet 23 as shown by arrows 29 in Figure 1A. The center of the tappet 23 thus provides a tappet channel 28 through which fluid can flow when the seat 19 is not occupied by ball valving member 20. Annular seat 30 can include beveled surfaces on piston 17 and tappet 23 to form a sealing interface in between the bottom of upper piston 17 and the top of tappet 23. Dart valving member 31 has an upper end portion 32 and a lower end portion 38. A flat surface 39 at lower end 38 can form a seal with

seat 37 of second, lower piston 36.

To begin operation of the device, a shear pin or shear pins 34 (Figure 1B) affix the position of dart valving member 31 in a fixed position relative to tool body 11. The ball valving member 20 is dropped from the surface via the flow bore of a coil tubing unit, work string, or the like. The ball valving member 20 is transmitted to the bore 16 using fluid flow. The ball valving member enters bore 16 at upper chamber 35 immediately above tappet 23 and piston 17. The ball valving member then registers upon seat 19 as shown by the phantom lines indicating the position of ball valving member 20 in Figure 1A when it is forming a seal upon seat 19.

When the dart valving member 31 is pinned in place with shear pins 34, pumping fluid can pass through the tappet channel 28 and into flow channel 27 along the path indicated by arrows 29 in Figure 1A. To activate the tool, the ball valving member 20 is pumped down from the surface via a coil tubing unit, work string or the like to the bore 16 and above piston 17 into upper chamber 35.

The ball valving member 20 seats upon seat 19 sealing the upper chamber and thus discontinuing the flow of fluid through the tool body 11. Hydrostatic pressure then builds up in upper chamber 35 above piston 17 due to the ball valving member 20 sealing upon seat 19. Upper piston 17 has O-ring 18 that also contributes to the seal.

When pressure differential builds up sufficiently across piston 17, valve 31 is pressured down and the shear pin (or pins) 34 shear, allowing the dart valving member 31 with its flat valve surface 39 to move downwardly in tool body 11, and seal upon seat 37 of lower piston 36. Once this seal occurs at seat 37, pressure builds up in bore 16 of tool body 11 above seat 37 and above piston 36. Seals 40 are provided on piston 36.

The combination of the seals 40, the piston 36, and the seal of flat valving surface 39 upon seat 37 causes the lower piston 36 to move downwardly, gradually compressing and storing more and more energy in spring 43. At this time, the dart valving member 31 is held in position upon seat 37 by pressure differential above seat 37, thus pulling the dart valving member 31 downwardly, also storing energy in trip spring 50. The upper end 32 of dart valving member 31 provides a beveled annular surface 51 that corresponds in shape to the beveled annular surface 52 of trip washer 49.

When the dart valving member 31 and trip washer 49 move down as trip spring 50 is collapsed, the trip washer 49 encounters annular shoulder 47, breaking the seal at seat 37 between valving member 31 and piston 36. The trip spring 50 then causes the valving member to rapidly fly upwardly, its flat surface 33 striking the correspondingly shaped flat surface 24 of tappet 23. This action of valving member 31 striking tappet 23 creates a momentary seal at seat 30, interrupting incoming fluid flow. This flow interruption also allows the piston 36 to move upwardly in the tool body 11 very rapidly, striking an impact ledge or anvil in the form of an annular shoulder 53 (see Figure 1B).

The tool upper body section 14 is attached to the lower tool body section 15 through slip joint 46. This allows the force of the upper blow delivered by piston 36 to exceed the tension applied from the surface through the coil tubing unit, work string or tubing string. The tension is transmitted from upper tool body section 14 to lower tool body section 15 through annular shoulders 54, 55. The slip joint can be attached to the lower tool body section 15 using threaded connection 56 and set screws 57.

The following table lists the parts numbers and parts descriptions as used herein and in the drawings attached hereto.

# PARTS LIST

	Part Number	Description

The foregoing embodiments are presented by way of example only; the scope of the present invention is to be limited only by the following claims.

## CLAIMS

1        1. A downhole jar apparatus for use in oil and gas wells,  
2 comprising:

3            a) an elongated tool body having an upper end portion  
4 and a lower end portion, and a longitudinal flow bore that enables  
5 fluid to flow through the tool body from the upper end to the lower  
6 end;

7            b) an upper piston mounted at the upper end portion of  
8 the tool body, movable between upper and lower positions and having  
9 a valve seat;

10           c) a lower piston mounted below the upper piston,  
11 movable between upper and lower positions and having a valve seat;

12           d) a first valving member for sealing the valve seat  
13 of the upper piston so that hydrostatic pressure can build up above  
14 the upper piston;

15           e) a second valving member disposed in between the  
16 upper and lower piston and having a lower valving end portion that  
17 forms a seat with the lower piston seat, the second valving member  
18 being movable downwardly in the tool body bore responsive to a  
19 pressure increase above the upper piston;

20           f) a trip mechanism for separating the second valving  
21 member from the lower piston seat when a predetermined pressure  
22 value is overcome;

23           g) a return mechanism for returning the first piston  
24 to its upper position when the trip mechanism separates the second  
25 valving member from the lower piston seat; and

26           h) wherein the tool body has an anvil portion  
27 positioned above the lower piston for receiving force from the  
28 lower piston when it is returned to its upper position by the  
29 return mechanism.

1        2. The jar apparatus of claim 1 wherein the tool body

2 includes upper and lower tool body sections attached together end  
3 to end with a slip joint.

1 3. The jar apparatus of claim 1 wherein the first valving  
2 member is a member that can be transmitted to the tool body via a  
3 work string.

1 4. The jar apparatus of claim 3 wherein the first valving  
2 member is a ball shaped valving member.

1 5. The jar apparatus of claim 1 further comprising a tappet  
2 that is positioned below the upper piston and above the second  
3 valving member.

1 6. The jar apparatus of claim 5 wherein the tappet and upper  
2 piston are separately movable members, and a seat interface is  
3 provided at the interface between the bottom of the upper piston  
4 at top of the tappet.

1 7. The jar apparatus of claim 1 wherein the second valving  
2 member has a generally flat upper end.

1 8. The jar apparatus of claim 1 wherein the second valving  
2 member has a generally flat lower end.

1 9. The jar apparatus of claim 1 wherein the trip mechanism  
2 includes a compressible member.

1 10. The jar apparatus of claim 9 wherein the compressible  
2 member is a spring.

1 11. The jar apparatus of claim 9 wherein the trip mechanism

2 includes a compressible spring and a trip washer that cooperates  
3 with an annular shoulder on the tool body to separate the second  
4 valving member from the lower piston as the second valving member  
5 moves downwardly in the tool body.

1 12. The jar apparatus of claim 1 wherein the return mechanism  
2 includes a compressible member.

1 13. The jar apparatus of claim 12 wherein the compressible  
2 member is a spring.

1 14. The jar apparatus of claim 1 wherein the valving member  
2 is preliminarily secured to the tool body with one or more shear  
3 pins that shear as hydrostatic fluid pressure is increased.

1 ~~15.~~ A downhole jar apparatus for use in oil and gas wells,  
2 comprising:

3 a) an elongated tool body supportable by a work string  
4 and having an upper end portion and a lower end portion, and a  
5 longitudinal flow bore that enables pressurized fluid to flow  
6 through the tool body from the upper end to the lower end;

7 b) an upper piston mounted at the upper end portion of  
8 the tool body, movable between upper and lower positions and having  
9 a valve seat;

10 c) a lower piston mounted below the upper piston,  
11 movable between upper and lower positions in the tool body and  
12 having a valve seat;

13 d) a first valving member for sealing the valve seat  
14 of the upper piston so that pressurized fluid can build hydrostatic  
15 pressure above the first valving member and upper piston;

16 e) wherein the upper piston is an assembly that  
17 includes an upper piston member and a tappet that carries the upper

18 piston seat, the tappet and upper piston member being separable  
19 members that move downwardly together when the first valving member  
20 seals upon the valve seat of the upper piston assembly;

21 f) a second valving member disposed in between the  
22 upper and lower pistons and having a lower valving end portion that  
23 forms a seat with the lower piston seat;

24 g) a trip mechanism for separating the second valving  
25 member from the lower piston seat when a predetermined pressure  
26 value in the tool body flow bore above the upper piston and first  
27 valving member is overcome;

28 h) a return mechanism for returning the first piston  
29 to its upper position when the trip mechanism separates the second  
30 valving member from the lower piston seat; and

31 i) wherein the tool body has an anvil portion  
32 positioned above the lower piston for receiving force from the  
33 lower piston when it is returned to its upper position by the  
34 return mechanism.

1 16. A downhole jar apparatus for use in oil and gas wells,  
2 comprising:

3 a) an elongated tool body supportable by a work string  
4 and having an upper end portion and a lower end portion, and a  
5 longitudinal flow bore that enables pressurized fluid to flow  
6 through the tool body from the upper end to the lower end;

7 b) an upper piston mounted at the upper end portion of  
8 the tool body, movable between upper and lower positions and having  
9 a valve seat;

10 c) a lower piston mounted below the upper piston,  
11 movable between upper and lower positions in the tool body and  
12 having a valve seat;

13 d) a first valving member for sealing the valve seat  
14 of the upper piston so that pressurized fluid can build hydrostatic

15 pressure above the first valving member and upper piston;  
16 e) a second valving member disposed in between the  
17 upper and lower pistons and having a lower valving end portion that  
18 forms a seat with the lower piston seat;  
19 f) a trip mechanism for separating the second valving  
20 member from the lower piston seat when a predetermined pressure  
21 value in the tool body flow bore above the upper piston and first  
22 valving member is overcome;  
23 g) a return mechanism for returning the first piston  
24 to its upper position when the trip mechanism separates the second  
25 valving member from the lower piston seat; and  
26 h) an anvil carried by the tool body for receiving  
27 blows from the lower piston when the lower piston travels upwardly  
28 in the tool body.

# ABSTRACT OF THE DISCLOSURE

A downhole jar apparatus for use in oil and gas wells provides an improved construction that features a movable piston that imparts upward blows to the tool body during use. The apparatus includes an elongated tool body having upper and lower end portions and a longitudinal flow bore for enabling fluid to pass from the upper end of the tool body to the lower end portion thereof. A pair of pistons are slideably mounted within the tool body including an upper piston having a seat and a lower piston having a seat. A ball valving member is used to seal the upper piston, that ball valving member being pumped down through a work string such as a coiled tubing unit in order to reach the seat of the upper piston. A second valving member in the form of an elongated dart is disposed in between the two pistons. A trip mechanism separates the second valving member from the lower piston when a predetermined hydrostatic pressure value is overcome. Once the second valving member and lower piston are separated, the second piston is fired upwardly striking an anvil portion of the tool body to create the upward jar or blow.

FIG 1C

Attorney Docket No. A98054US**DECLARATION****SOLE/JOINT INVENTOR  
ORIGINAL/SUBSTITUTE/CIPI**

As a below named inventor, I hereby declare that: my residence, post office address, and citizenship are as stated below next to my name. I believe I am the original, first, and sole inventor (if only one name is listed below) or a joint inventor (if plural inventors are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

**"DOWNHOLE JAR APPARATUS FOR USE IN OIL AND GAS WELLS"**

as described in the specification by attached or [ ] of patent Application Serial No. \_\_\_\_\_, filed \_\_\_\_\_

and amended on \_\_\_\_\_

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above; that I do not know and do not believe the same was ever known or used in the United States of America before my or our invention thereof, or patented or described in any printed publication in any country before my or our invention thereof or more than one year prior to this application; that the invention has not been patented or made the subject of an inventor's certificate issued before the date of this application in any country foreign to the United States of America on an application filed by me or my legal representative or assigns more than twelve months prior to this application; and that I acknowledge the duty to disclose information of which I am aware which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations § 1.56(a). Such information is material when it is not cumulative information already of record or being made of record in the application, and

(1) it establishes, by itself or in combination with other information, a prima facie case of unpatentability of a claim; or

(2) it refutes, or is inconsistent with, a position the applicant has taken or may take in:

(i) opposing an argument of unpatentability relied on by the Office, or

(ii) asserting an argument of patentability.

I hereby claim foreign priority benefits under Title 35, United States Code § 119 of any foreign application(s) for patent or inventor's certificates listed below and have also identified below any foreign application(s) having a filing date before that of the application(s) on which priority is claimed:

COUNTRY	APPLICATION NUMBER	DATE OF FILING	PRIORITY CLAIMED UNDER 35 USC 119
			<input type="checkbox"/> YES <input type="checkbox"/> NO
			<input type="checkbox"/> YES <input type="checkbox"/> NO

I hereby claim the benefit under Title 35 United States Code § 120 of any United States application(s) listed below and, insofar as any subject matter of any claim of this application is not disclosed in the prior United States Application, I acknowledge the duty to disclose material information as defined in Title 37, Code of Federal Regulations § 1.56(a) which occurred between the filing date of the prior application and the national PCT international filing date of this application:

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

**VERIFIED STATEMENT (DECLARATION) CLAIMING SMALL ENTITY  
STATUS (37 CFR 1.9(f) and 1.27(c)) - INDEPENDENT INVENTOR**

As a below named inventor, I hereby declare that I qualify as an independent inventor as defined in 37 CFR 1.9(c) for purposes of paying reduced fees under section 41(a) and (b) of Title 35, United States Code, to the Patent and Trademark Office with regard to the invention entitled "DOWNHOLE JAR APPARATUS FOR USE IN OIL AND GAS WELLS" by inventor(s) James E. Hipp described in:

- ☒ the specification filed herewith.  
☐ application serial No. \_\_\_\_\_, filed \_\_\_\_\_.  
☐ patent No. \_\_\_\_\_, issued \_\_\_\_\_.

I have not assigned, granted, conveyed, or licensed and am under no obligation under contract or law to assign, grant, convey or license, any rights in the invention to any person who could not be classified as an independent inventor under 37 CFR 1.9(c) if that person had made the invention, or to any concern which would not qualify as a small business concern under 37 CFR 1.9(d) or a nonprofit organization under 37 CFR 1.9(e).

Each person, concern or organization to which I have assigned, granted, conveyed, or licensed or am under an obligation under contract or law to assign, grant, convey, or license any rights in the invention is listed below:

- ☐ no such person, concern, or organization  
☒ persons, concerns or organizations listed below\*

\*NOTE: Separate verified statements are required from each named person, concern or organization having rights to the invention averring to their status as small entities. (37 CFR 1.27).

FULL NAME: SONOMA CORPORATION

ADDRESS: P. O. BOX 81094, LAFAYETTE, LA 70598-1094

( ) INDIVIDUAL (X) SMALL BUSINESS CONCERN ( ) NONPROFIT ORGANIZATION

I acknowledge the duty to file, in this application or patent, notification of any change in status resulting in loss of entitlement to small entity status prior to paying, or at the time of paying, the earliest of the issue fee or any maintenance fee due after the date on which status as a small entity is no longer appropriate. (37 CFR 1.28(b))

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application, any patent issuing thereon, or any patent to which this verified statement is directed.

**VERIFIED STATEMENT (DECLARATION) CLAIMING SMALL ENTITY STATUS (37 CFR 1.9(f) and 1.27(c)) - SMALL BUSINESS CONCERN**

I hereby declare that I am

           the owner of the small business concern identified below:

XX an official of the small business concern empowered to act on behalf of the concern identified below:

NAME OF CONCERN: SONOMA CORPORATION

ADDRESS OF CONCERN: P. O. BOX 81094, LAFAYETTE, LA 70598-1094

I hereby declare that the above identified small business concern qualifies as a small business concern as defined in 13 CFR §121.3-18, and reproduced in 37CFR §1.9(d), for purposes of paying reduced fees under section 41(a) and (b) of Title 35, United States Code, in that the number of employees of the concern, including those of its affiliates, does not exceed 500 persons. For purposes of this statement, (1) the number of employees of the business concern is the average over the previous fiscal year of the concern of the persons employed on a full-time, part-time or temporary basis during each of the pay periods of the fiscal year, and (2) concerns are affiliates of each other when either, directly or indirectly, one concern controls or has the power to control the other, or a third party or parties controls or has the power to control both.

I hereby declare that rights under contract or law have been conveyed to and remain with the small business concern identified above with regard to the invention, entitled "DOWNHOLE JAR APPARATUS FOR USE IN OIL AND GAS WELLS" by inventor(s) James E. Hipp, described in:

XX the specification filed herewith

\_\_\_\_\_ application serial No. \_\_\_\_\_, filed \_\_\_\_\_.

\_\_\_\_\_ patent No. \_\_\_\_\_, issued \_\_\_\_\_.

If the rights held by the above identified small business concern are not exclusive, each individual, concern or organization having rights to the invention is listed below and no rights to the invention are held by any person, other than the inventor, who could not qualify as a small business concern under 37 CFR §1.9(d) or a nonprofit organization under 37 CFR 1.9(e).
